Rapid and Reliable 1 µL UV-Vis

SmartPath™ Technology

The DeNovix team developed a combination of opto-mechanical components and software algorithms that optimize results for every sample. Micron-level pathlength control and immediate absorbance feedback deliver sensitive, accurate microvolume measurements.

Bridge Testing™ verification eliminates unreliable results that stem from broken sample columns or loading issues. The algorithm detects unbridged samples and automatically adjusts in real-time to deliver accurate results, even for challenging 1 µL protein samples.

SmartPath algorithms ensure that the sample is only compressed, never stretched, to keep the column intact.

Key Features

- Quantify DNA, RNA and protein using 1 µL of sample
- Widest dynamic range and lowest detection limit
- No routine maintenance or recalibration required
- Full spectrum UV-Vis analysis (190 - 840 nm)
- Single or eight channel format

SmartQC™ Contamination Alerts

Multiple algorithms ensure confidence in results while also providing important information about possible sample anomalies.

Surface Check	SmartPath™	Bridge Testing™	Spectral Analysis	Alert	Report
Check that previous sample has been removed.	Precisely select optimum pathlength for each sample.	Dynamic monitoring and adjustment ensures that sample column is formed.	Analyze for negative spectra, absorbance, within range, calculate purity ratios and quantify.	Check against threshold purity values. Flag contaminated samples. Display user guidance.	Save and report data ready for export. Optional auto-save to network drive.

Fluorescence

DeNovix 4-channel fluorometers increase the quantification sensitivity up to 1000x. Fluorescence mode is available either integrated into an instrument or through the convenient plug-and-play USB FX Module. DeNovix Fluorometers are compatible with a wide range of commonly used quantification assays.

1 Sensitivity

Extend the lower detection limit for low concentration samples. Quantify down to 0.5 pg/ μ L dsDNA.

2 Specificity

Selectively quantify a sample in the presence of contaminants using DeNovix Fluorescence Quantification Assays.

3 Total Sample QC

Combine Absorbance and Fluorescence measurements for specific quantification and reliable contamination detection.

Cuvette Absorbance

Use standard quartz or disposable cuvettes for up to 10 mm pathlength absorbance measurements (190 - 840 nm).

Cuvette applications include nucleic acids, proteins, colorimetric assays, OD600 and custom standard curves. Systems include a cuvette block heater for Kinetics studies from 37 - 45°C.
